

1. Improved comments in the files.
  - a. I added comments for every class definition: what the classes do, any interesting mechanism, external library requirements
  - b. I added comments for less obvious lines to better describe what my code is doing
2. Removed magic numbers from the code, and substitute them with Constants.<Constant name>
  - a. E.g Hardcoded port number becomes  
Constants.AGGREGATE\_SERVER\_PORT\_NUMBER
3. Added more test cases
  - a. Added an extreme test case with many requests from clients, content servers and aggregate server pinging the content server all happening concurrently. This test is meant to test the server's functionality to handle lots concurrent requests of different types without crashing.
4. Removed commented code
5. Added readme.txt
6. Added changes.pdf
7. Added some error checks to make sure that all the component fails securely, and prints useful information in case of unexpected inputs given, such as:
  - a. Invalid feed.txt path
  - b. Invalid server address and/or port
  - c. Invalid XML given from the aggregate server
